

# **Acute Low Back Pain**

**L**ow back pain is a significant public health concern affecting most adults sometime during their lifetime. Although some drugs can be effective in treating this pain, not all patients achieve the results they need. Since the effectiveness of drugs commonly used to treat this potentially debilitating condition is limited, it is important to search for new drugs to help treat this condition.

***Do you have moderate to severe low back pain that started in the last 30 days?***

***Do you also have pain that extends into your lower leg below the knee?***

If YES, you may be interested in learning more about a clinical research study of a pain medication that is being evaluated for the treatment of acute low back pain.

## **The Study Purpose**

- To find out if an approved oral pain medication may be useful in treating people who are experiencing moderate to severe acute low back pain that extends down to the lower leg below the knee
- To compare the effects (both good and bad) against another approved pain medication

## **You may be eligible to participate if you:**

- Are a male or non-pregnant, non-lactating female, 18 years of age or older
- Are experiencing moderate to severe low back pain that extends down the leg, below the knee
- Have had recent onset of pain, not longer than 30 days ago

## **Qualified study participants will:**

- Be reimbursed for study-related expenses (e.g., travel, parking, and meals)
- Be provided research-related medical care and medication at no cost

***We are actively seeking participants for this study.***
